PRIORITY FUR PROTECTION

Helmets, made by the dedicated hands of those who work at Arai, have shown examples of supreme protection for decades.

The numerous improvements by their experienced hands, and personal desire to further the protection of riders' heads, are among the many unique reasons Arai helmets perform the way they do.

From our very first helmet, to those we make today, rider protection remains our first priority and we at Arai shall never forget the value of what we have been seeking to protect is priceless.

GLANCING OFF

HEAD PROTECTION CAN BE CALLED MANAGING IMPACT ENERGY EXCEPT MANAGING THAT ENERGY IS NOT JUST ABSORBING IT

n the event of an impact, energy is created, and the role of a helmet is to 'appropriately manage the impact energy' to protect the rider's head. That energy management is generally achieved by 'absorption' of the impact energy around the head, thus protecting it. The outer shell deforms and the cells of the inner EPS liner crush, and that destruction manages impact energy by converting it into work. However, the truth is even the best helmet has limits to how much energy it can manage.

On the other hand, the helmet isn't only absorbing energy, but rather in a large crash when the rider's head is repeatedly protected by the helmet, we understand that it's working to manage impact energy in another important way.

That is 'glancing off'. Many people probably don't even realize this, but at the moment a helmet is impacted, if struck off center it can slide on the crash surface, minimizing the impact energy that might otherwise

be transferred to the rider's head. Therefore, if not directed toward the center of the helmet, the head inside can be protected, even with high energy levels and the liner's limited energy absorption ability. Even in extreme crashes we've witnessed 'glancing off' and 'energy absorption' as two halves of energy management that work together to increase the chances of head protection. This holds true for any kind of helmet.

HOW DOES A HELMET PRO

'Energy Absorption' and 'glancing off' are two wheels that can do the job of preserving balance that can work together without bias or offset.

All helmets protect the rider's head through both glancing off and energy absorption.

TECT YOUR HEAD?

Here is the moment of impact.
The rider tenses up, and the helmet contacts the ground. You can imagine what the helmet has to do next.

'Energy absorption' can be called when an obstacle collides with a helmet and the energy from the impact enters the helmet. We call this 'impact energy'.

HOW DOES A HELMET PROTECT YOUR HEAD

GLANCING OFF WORKS TOGETHER WITH ENERGY ABSORPTION INVISIBLE TO YOUR EYES

hen we talk about 'lmabsorption ability' there will be a limit regardless of any manufacturing technique employed, because of the limited amount of space between the shell and rider's head necessary to manage impact energy (see below "The Limit of Absorption Ability"). And on a motorcycle, we have to prepare for impacts that far exceed our imagination. So it follows that glancing off is critical for supporting that. Arai's helmet exhibits results due to its strong shell combined with its round smooth surface and achieves the important goal of not letting energy into the helmet.

However, helmet standards place their emphasis on impact absorption and do not show anything about glancing off. Glancing off is the synergy of various elements working together, and there is no set way to impact a helmet to test for it.

In the unlikely event of an impact, the common case is the helmet receiving an impact from an oblique angle, rather than a 90 degree angle. So the obstacle moves past the impact point with the helmet while sliding off the moment the helmet hits at an oblique angle.

There is a test for shell strength to resist penetration, though because it's difficult to put numbers to the shell form and such for glancing off, there remains no definition. Any helmet makes use of glancing off, but due to the difficulty in numerically capturing each helmet's difference in ability, there are many cases where safety standards simply don't define glancing off.

In addition to passing standards, Arai

makes continual efforts to improve our helmets' glancing off ability and pursue gains in head protection.

The amount of energy in a crash can be expressed as distance and force, where distance is the physical space between the helmet shell surface and the rider's head, or in other words the helmet size. If you make the helmet user-friendly, there will be a limit to its size. Regardless of construction or material employed, there's still a limit to the space available in a helmet.

HOW DOES A HELMET PROTECT YOUR HEAD

AIMING TO BE THE BEST IN THE WORLD

hen it comes to proficiency in head protection, Arai has the goal of making a helmet

superior to all others and continues to make our helmets this way today. We have seen this confirmed in many of our rider crashes over several decades, and we pursue gains in protection even if just a little.

Because we come from this background, we've come to notice the importance of the smoothness of the helmet as a component above all others and continue to employ it in our approach. Head protection is the foundation of our belief in being the best in the world and we pursue the value of both 'glancing off' and 'impact absorption' equally. This is the difference of Arai.

Arai's desire is to pursue gains in protection wherever possible, and glancing off plays a major role in improving impact performance.

Helmet Scars from Impacts

MACT ENERGY

helmet standards testing. It numerically measures the impact when a helmet collides with an obstacle straight on. Diagonal scars are left on the helmet where it received a perpendicular impact. On the other hand, impacts can be received from different angles and the scars flow horizontally from the impact point. *See riding impact case examples.

Impact scars from drop test (hemisphere anvil)

THE EVOLUTION OF FORM CONTINUES AS TIME GOES BY

lancing off cannot be adequately quantified as a basis of head protection. In crashes, an impact can come from any angle at any speed and cannot be prepared for. Also, the exact speed and angle of an impact cannot be replicated 100%. So as for the development of 'glancing off', there's nothing that can be done except to accumulate improvements that we think we should do through experimentation and small adjustments to combat every possibility.

From the scars left by rider impacts,

we can gather that the helmet was able to slide past obstacles and not catch or snag because of its smooth surface. In other words, we surmise they exhibited 'glancing off' properties. So, the shape of Arai helmets will be round and smooth to the very end. We have kept the same basic shape since the beginning, and think it alleviates impact energy more so than a shell with an exaggerated shape with hard edges that may catch. Our helmets evolved from a cannonball shape when first introduced, into an egg shape today, to better blend the entire outer surface more smoothly. The current shape of an egg is a simple sphere evolved in nature for survival. Arai also evolved towards the egg shape with the notion to protect the rider's head as much as possible from impacts that might exceed expectations.

The whole helmet has evolved to receive impact energy with its round surface to address obstacles, and reduce flat facets in the shell.

TION OF GLANCING OFF

R75

The aero parts and vents that keep the rider comfortable break off in an impact by design.

Our helmets are designed to avoid protrusions in the shell. They also have a continuous round and smooth spherical form maintaining a radius of no less than 75mm, which we call R75, in the head protection area of the helmet according to Arai's in-house criteria.

VAS SHIELD

Designed for improved function, but more importantly to increase the continuous smooth shape of the shell.

VAS aims to increase the 'glancing off' ability of the helmet by maintaining the smooth shape of the helmet above all.

STRENGTH

CONTINUALLY SEEKING THE STRONGEST MATERIALS AND BEST TECHNIQUES AT THE FOREFRONT OF TECHNOLOGY

HYPER RIDGE

At the bottom of the shell there is a three-dimensional 'Hyper-Ridge'®, a step in the shell designed to stop the migration of cracks that form when the helmet receives an impact.

SPECIALIZED GLASS FIBER

Arai's top models utilize the same material found in a bulletproof vest in the crown part of the shell, which is expensive but strongest in function to maintain strength, reduce weight, and lower the helmet's center of gravity for reduced rider fatigue.

Shell evolution involves more than

improvements in construction, material, and manufacturing techniques. Rather, we pursue strength from the shell shape. All elements of shell shape are connected to the function of the helmet.

hell strength is very important for enhancing 'glancing off'. In a crash, if the shell deforms or is completely destroyed it can no longer slide and will stop and catch on that point. A helmet that can't slide can't maintain its 'glancing off' ability and that impact energy can reach the rider's head.

Since we've decided on being the number one helmet in the world for protection, we've pursued shell strength as well as weight reduction by accumulating improvements that embody the lifeblood of Arai. This evolved into the development of the cLc shell process (complex laminate construction) which encompasses both strength and lightness. Although the cost of the material utilized is 6 times higher than conventional fiberglass, Arai exploits its

use for a stronger and lighter helmet. To prevent cracks from spreading to the helmet's edge, the critical edges of the shell have a Super Fiber Belt which reinforces these areas like the bands of a barrel. The resin blend as well is evolved through our obsession with strength and weight reduction as we continue to accumulate various improvements.

Between the high strength fibers, special lightweight elastic fibers are sandwiched between, which is the Complex Laminate Construction (cLc). It offers a 20% weight reduction compared to making it with just all the same fiber.

The top of the eye port has a Super Fiber Belt which reinforces the helmet like the bands of a barrel for better protection. This special belt suppresses the spreading of cracks that form when the helmet receives a large impact and improves glancing off.

EPS LINER

ven the best 'glancing off' ability alone won't protect the rider's head. 'Impact absorption ability' is necessary to pass even the strictest helmet standard in the world. In the

Arai's proprietary 1PMDL (one piece multidensity liner) is the only one of its kind in the world and offers incredible protection by being fine-tuned to each shell size, in each model and in each head size, with varying EPS densities.

impact absorption ability test, the shell surface deforms when it receives an impact with the helmet hitting obstacles of certain angles and shapes.

If the impact surface is narrow, concentrating the impact energy, the EPS liner must naturally be thicker. However, while that makes it easier to pass helmet standards, making the EPS liner thicker only in the necessary places ends up distorting the helmet shape away from 'round and smooth'.

It doesn't maintain a form ideal for making the most of 'glancing off'. Arai's proprietary 1-piece multi-density EPS liner has finely-tuned sections with various densities. It can make the most of its 'glancing off' ability because the

EPS density varies according to the corresponding shell surface, allowing the shell to remain 'round and smooth'. This 1-piece multi-density liner is indispensable for improved results in Arai's strength of the shell shape pursuing 'glancing off' performance.

The head form shape used in helmet testing is somewhat square, so the 'four corners' get tight inside the helmet, and we can see a tendency to make the shell square too.

The liners used by some other helmet manufacturers may have multiple densities, and have separate pieces with seams where they are assembled, or use a non EPS liner type. All address impact energy in a vertical drop from a set distance in helmet standard tests, where there is no difference in absorption ability. However, it's difficult to manage an impact you cannot foresee on the road or track which could come from any direction.

On the other hand, if the liner is 1 piece multi-density, it has unbroken bonds between all densities and can stop the spread of impact energy more efficiently.

In a crash we can confirm the effective combination of the liner-shell system. Furthermore it exhibits ideal absorption performance

in side impacts as well because it's designed with glancing off. The 1PMD liner is the ideal ingredient in impact energy management where it can manage impact energy from any direction and address impacts unknown to the rider.

[SUMMARY]

Glancing Off, together with Energy Absorption, is an Important Aspect of Rider Protection.

THE DUTY TO PROTECT

ithout energy absorption ability a helmet can be called meaningless. Though, in a crash any helmet will protect the rider's head by two roles: 'glancing off' and 'impact absorption'. While impact absorption can be measured, the shape that bears 'glancing off' cannot, but because of its relative ease of skipping past obstacles in a crash, the truth is it plays a large role in the helmet.

And as mentioned above, in many cases we're riding above the speeds in a test environment. Crashes can exceed the absorption ability of the helmet and involve immeasurable impact energy, and even the best helmet would not be able to manage it.

In the event of a crash, the number one goal is preventing impact energy from reaching the head. Before absorption, most energy can be avoided. This 'glancing off' shell shape plays the important role in going beyond just 'impact energy absorption'.

Because crashes can exceed expectations.

Please see for yourself at your local dealer

Arai continues its pursuit of 'glancing off' performance. However, 'glancing off' ability cannot be confirmed by seeing a certification label.

You can probably say the 'glancing off' ability of our helmets is high when you feel the smooth shell with your own hand, improved with breakaway vent covers. We invite you to feel and compare with your own hands.

Confirm Glancing Off

A form with few changes in its shape, consistently round, is difficult to deform in impacts, and can be said to have high glancing off ability.

2

Feel for yourself the lower part of the shellas well doesn't lose the round smooth shape.

The Consistent Pursuit of Gains in Protection

Pursuing Gains in Protection

Emphasizing the Accumulation of Various Improvements, bearing in mind our mission to protect the Rider.

Arai is the collection of people devoting themselves to the path of protecting the rider's head and the thought that the helmet has the noble duty, with the utmost meaning of potentially saving someone's life. To pursue advancing the ability of how a helmet should protect the rider from a crash, while we enjoy motorcycles, and continue to accumulate such gains in protection is our goal.

But the severity of crashes can far exceed our expectations, so even making the helmet with our goal in mind, we bear the regrettable thought of knowing there is a limit to the helmet's protective ability.

We at Arai remain determined to pursue superior protection above all other helmets and to not lose pride in what we're doing.

What should we do to combat crash impacts? There's no simple answer or solution to this question. We've continued on a straightforward path of searching for every factor we can find, one-by-one, accumulating even small improvements since we made our first helmet more than 70 years ago.

So now, Arai believes we have fostered a brand that has received the recognition from many around the world that say 'Arai's protection is different'.

Il helmets that are available in the European market must meet the requirements of the mandatory standard. While it's important to meet these requirements, it is not the only goal for Arai for riders' protections. In addition to meeting these requirements, Arai also has in-house criteria to pursue gains in protection for riders.

From the very beginning of the foundation of the Arai Helmet company, which was founded before the existence of mandatory standard in Japan, we have always focused on riders' protection and seeking improvements, even if small. There is no magic wand, or one solution to gain more protection. The only way to improve is by making small improvements one by one, building on our foundation,

even at higher and higher costs, trusting that over time all these accumulated improvements would work together, reaching a higher level of protection than before, creating a new base level from which we can improve. Only a three-generation family company of motorcycle riders like Arai can foster this company environment to maintain this dedication to rider protection.

MAKE FASTER, EASIER.

he RX-7V FIM Racing #2 is the world's first helmet homologated to the FIM FRH-Phe-02 standard, and the go-to helmet when racing in FIM sanctioned events. While the new FIM FRH-Phe-02 becomes mandatory from 2026, our decades long priority for protection has resulted in having our flagship model already homologated to both FIM FRHPhe-02 and ECE R22-06 standards.

Head protection means managing impact energy. Many understand it to be about absorbing energy. But that's just part of it. The less impact energy that gets into the helmet, the less needs to be absorbed. Arai does that by making rounder, smoother and stronger outer shells to improve 'Glancing Off' performance and reduce impact energy transferring into the helmet.

The RX-7V FIM Racing #2 is Arai's ultimate racing helmet made from Arai's Priority for Protection.

SETTING THE STANDARD.

he RX-7 has always been the benchmark of Arai's motor-cycle racing R&D at the very highest level. Handmade in Japan by a three-generation family company of riders, it is Arai's state of-the-art helmet.

The new RX-7V EVO, apart from accumulated improvements under the skin, looks identical. Because it is. The difference? Everything. And most recently ECE R22-06 approval. But, even after meeting the most recent standard, Arai does not rest and continues to look for new ways to improve rider protection, making us better prepared to meet the next standard when it comes. ECE R22-06 requires a much more stringent testing process than the previous ECE R22-05.

Arai presented the RX-7V EVO and it gained homologation while maintaining its characteristic round, smooth and strong shell design to 'glance-off' and spread impact forces. Or simply put, by being an Arai RX-7V EVO.

There is a difference with Arai. It's the combination of every single piece of design, no matter how large, small or even invisible, working on behalf of the rider. Because what we protect is priceless.

there is a difference

Ventilation

The combined systems offer excellent and efficient ventilation. Utilizing the same proven system as the RX-7V, the centre duct provides 11% more airflow, with bigger switches for effortless operating. The lowered side-air channels guide air from the cheek pad area to the side ducts. The diffuser is 20 mm longer with improved aerodynamics, and 19% larger intake scoops, both work together with the Air Wing to improve stability. The chin cover blocks air intrusion and draws more air from the mouth area.

QUANTIC

QUANTIC

HIGH-SPEED COMFORT FOR THE LONG HAUL.

s with every Arai, the Quantic is formed around protection, first and foremost. Manufactured by hand, the outer shell maintains core strength but with a substantial weight reduction. The smooth, round shape is a key Arai signature and primarily designed to 'glance-off' and spread impact forces. Using the aerodynamic and protective abilities of Arai's full-race helmets and all the experience and know-how earned over millions of road kilometres, the new Quantic slips through the air neatly and efficiently, wrapping its wearer in a cocoon of luxury. It offers a fresh choice for riders that want the very best performance from a helmet - in terms of protection, comfort and ease of wear, day-in-day out - with zero compromise. For easy access on and off the Quantic features a 5mm flare around the base, while the VAS MAX vision visor comes with a Pinlock insert ready to use. The premium brushed nylon interior is removable and features Facial Contour System (FCS) and neck roll wire pocket. It also features Emergency Release System (ERS). The Quantic will be on the market with the official ECE R22-06 homologation.

there is a difference

Ventilation

Comprehensive and controllable ventilation is based around 12 ventilation ports: 6 intake, 6 exhaust. The 3D Arai logo feeds cooling air into two central intake points and works well at low speed, alongside dual F1-derived tear duct top intakes, twin brow vents and 2-position sliding air-scoop, filtered chin vent. Hot air is efficiently extracted via the 3-way one-piece rear exhaust/spoiler, twin flush-fit side exhausts (with foam dams to reduce noise) and neck exhaust.

OLD SCHOOL COOL. MINUS THE COMPROMISES.

he 1980s. Naked motorcycles. An attitude that made you feel different from everybody else. Introducing the Concept-XE. Recalling the simple yet aggressive style of that era, this helmet came from the heart of Arai R&D. They loved the looks, but that was about it. Now, the Arai techs want old-school cool, to fit their style and motorcycle, but they want cool with modern Arai performance. Concept-XE's brute simplicity is the product of imagination, but make no mistake, while the retro style may grab attention it had to pass Arai's stringent in-house testing. So underneath the aggressive look you'll find a strong, lightweight PB e-cLc shell, with a smooth and round shape, reinforced with Arai's proprietary peripheral belt, to slide across surfaces and glance-off obstacles. The VAS-VC shield system, with its retro mechanical look, further enhances glancing off performance by lowering the visor pivot point to maximize a smooth upper shell. Although a nod to the past, the Concept-XE is very much a helmet of the present. Ready for a generation of modern riders that demand a new, old style - but with the performance and comfort only an Arai can provide.

there is a difference

Ventilation

The Concept-XE's sleek outer shell hides a secret; Arai's internal ventilation system. Cooling air feeds into the visor brow vents and is drawn through the comfort liner and out three upper crown exhaust holes, via a hidden multi-stage air channel within the EPS liner, by the negative pressure created by the combined Venturi effect of the side exhaust ports and neckroll vent. Up front the six meshed slots close to demist and open for airflow.

VARIABLE AXIS SYSTEM (VAS)

IMPACT ENERGY CAN BE DISCHARGED IF THE HEAD CAN KEEP MOVING.

he basic structure of the human head can be roughly divided into three components; scalp, skull and brain. The role of a motorcycle helmet is to minimize and manage impacts to the brain. Laboratory impact test standards vary somewhat, but generally all define of a moving object increases in proportion to the square of the speed. Therefore, a street rider, traveling at legal limit, can carry up to more than 10 times the amount of kinetic energy. No helmet, regardless of brand or design, can be expected to manage such energies.

SAI shield RX-7 GP

VAS shield RX-7 V EVO

EVOLUTION OF THE RX-7V EVO: The world's first shield system to get so close to the ideal shell form.

shock absorption levels. Those levels are tested by dropping a helmet, with a steel head form from a predetermined height onto a steel anvil. The G meters within the head form measure the G forces sustained in these drop impacts to verify the impact absorption performance. Standards such as Snell set the test criteria quite high to obtain certification approval.

Under impact the helmet acts as a buffer, the outer shell displaces the energy and the inner liner absorbs the energy as it crushes, slowing the impact speed. The examination of the impact energy management performance of the standard is very different from an accident which occurs in an unpredictable and severe environment. The kinetic energy

Keep smoother and rounder within the test area.

Therefore, Arai believes that "Glancing off" performance would be important to divert energies by keeping the head moving. For potential impacts with energies above those of the stand-

ards, and even above what a helmet might be able to deal with directly, Arai has always tried to make helmets rounder, smoother and stronger throughout its long history. However, even at Arai there are limitations to how round and

Variable Axis System (VAS)

smooth a helmet can be due to the restrictions of a single pivot shield mechanism. The geometry of current shield systems require a high pivot position. This high pivot point falls within the test area of the standard, across the test boundary lines at the left and right temple area.

The shield is attached to the helmet with a mounting/pivot mechanism. To maintain a smooth/flush transition from shield to shell, the shell area where this mechanism attaches must have some depression or recess. The current shield systems, with some portion of the mechanism within the test area, prevent the shield from maintain a smooth and contiguous curved surface.

VAS is a completely new shield system with a mechanism invented with the sole purpose of eliminating this intrusion into the test area, allowing the shell along the test line at the temples to be made smoother. The new smoother shape is the next generation that aims to further improve on the original mission.

Through decades of experience with real world road and track scenarios, Arai has developed a helmet compiled of detail upon detail that work together and improve the protective capacity of the helmet.

ULTIMATE OFF-ROAD EXPERIENCE.

he MX-V has gained EVO status and is the new benchmark for MX, Enduro, and off-road use. The round and smooth shape of an Arai helmet works to improve protection. For this reason, no exaggerated edges or protrusions will be part of an Arai helmet shell.

Arai's Priority for Protection: the core design philosophy of producing rounder, smoother and stronger outer shells to improve 'Glancing Off' performance, is key in this attainment, as is the rigorous inhouse criteria that all Arai helmets must satisfy.

there is a difference

CAR HELMETS

RACE TESTED.

efore we start there is one piece of very important information you must know about Arai's car racing helmets. Whether at the very top in F1 - where we've been since 1984 – or just starting out in karts (and all points in between) we do not make custom 'racing helmets' for drivers. The exact same Arai helmets you see on the track, worn by any driver in any series are available to you directly at your local Arai dealer. All of our car racing helmets, with all of their technical features and detailed functionality are product of a depth of knowledge built on the experience of decades - there are no short cuts. It's as simple as that.

Arai has been at the forefront of car racing for many decades and to date, many of the world's top drivers competing in all 4-wheel racing disciplines from Formula 1 to WTCC wear our helmets.

ARAI GENERAL FEATURES

Five times inspected

Each Arai helmet goes through five separate quality-control departments: after the shell is made, after painting and graphic completion, after assembly and two in-process inspections.

Washable interior

The premium quality interior of any Arai helmet can be easily cleaned, in place, with mild soap and lukewarm water.

Handmade

It can take up to five years for our experts to earn the right to create an Arai shell. Each shell can take up to 27 steps and to build one Arai helmet will take about 18 man-hours

All-day comfort

All-day comfort with the Arai interior fit and shape together with the finest liner materials and the extensive ventilation system. And thanks to the perfect balance and weight distribution of the helmet, you hardly notice you are wearing an Arai.

Penetration tested

All Arai helmets are penetration tested, although not required by European helmet standards. The Arai penetration test is performed with a 3kg test cone that strikes from a height of 3m on the helmet.

Double-D ring device

The flat and D-shaped rings fit smooth against the chin. No moving parts, no corrosion problems and just pulling the tab is enough to loosen the fastener.

Smooth shape, better protection

The smooth outer shell of Arai helmets is designed to glide without unnecessary resistance. You don't want to decelerate your helmet more than necessary. That's why all Arai vents and ducts are designed to break off during an impact.

Strong outer shell, soft inner shell

Arai uses a very strong outer shell to spread impact forces and a soft inner shell to absorb remaining energy. The multipledensity EPS inner shell is made using a unique technology of combining three to five densities in various areas as a single component.

Organic shape

The organic shape of an Arai outer shell offers a more natural appearance, seals better and conforms more to the head's natural shape for improved comfort, fit and to help minimize wind turbulence.

5-year limited warranty

All Arai helmets are warranted against defects in materials and workmanship, and are serviceable only for the properly fitted first user for 5 years from date of first use, but no more than 7 years from date of manufacture.

Different outer shells

Unlike many other manufacturers Arai provides one size outer shell for each two-helmet sizes for most models. Together with different shaped outer shells for different models it is almost impossible not to find the fit you are looking for.

Arai In-house test

Arai helmets are designed to meet the stringent Arai Inhouse criteria, in addition to the mandatory ECE standard.
